

proposal

Hotel management is a computer system designed for maintaining the data and access to manipulate when needed. All the tasks are performed programmatically with a simple user interface for any of the user. It keeps hotel information like hotel name, foods ordered from each room, list of rooms available or vacant. Also, it has information about customers who checked into the hotel, such as the name, contact, and ordered food to be served. The software also keeps a record of all the cuisine the hotel offers, including the current order of that food, available quantity and price.
